Model of Super Spreaders

Hannah Craddock

July 2021

Model

Let $x_t = \psi_t + \zeta_t$

where

$\psi_t =$ Number of non-superspreaders

$\zeta_t = x_t - \psi_t =$ Number of superspreaders

Probability

$$P(X_t = x_t) = \sum_{k=0}^{x_t} P(\psi_t = k) \cdot P(\zeta_t = x_k - k)$$

i. ψ_t - Non super-spreading individuals

$\psi_t \sim Poisson(a \cdot \lambda_t),$

$$p(\psi_t) = exp(-a \cdot \lambda_t) \cdot \frac{1}{\psi_t!} \cdot (a \cdot \lambda_t)^{\psi_t},$$

with

$$\lambda_t = \sum_{i=1}^{t-1} \left(\psi_i + c \cdot \zeta_i \right) \cdot \left(\Gamma(t-i; k, \theta) - \Gamma(t-i-1; k, \theta) \right)$$

ii. ζ_t - Super-spreading individuals

$\zeta_t \sim Poisson(b \cdot \lambda_t),$

$$p(\zeta_t) = exp(-b \cdot \lambda_t) \cdot \frac{1}{\zeta_t!} \cdot (b \cdot \lambda_t)^{\zeta_t},$$

Likelihood

$$P(x_t) = \sum_{\psi=0}^{x_t} P(\psi) \cdot P(z_t)$$

$$L(a,b,p,\lambda | \, \mathbf{x_t}) = \prod_{t=1}^{Ndays} \sum_{\psi=0}^{x_t} P(\psi) \cdot P(\zeta)$$

$$= \prod_{t=1}^{Ndays} \sum_{\psi=0}^{x_t} \left(p \cdot exp(-a \cdot \lambda_t) \cdot \frac{1}{\psi!} \cdot (a \cdot \lambda_t)^{\psi} \quad + \quad (1-p) \cdot exp(-b \cdot \lambda_t) \cdot \frac{1}{\zeta!} \cdot (b \cdot \lambda_t)^{\zeta} \right)$$

Log Likelihood

$$l(\alpha, \beta, \gamma, \lambda | \, \mathbf{x_t}) = ln\left(\prod_{t=1}^{Ndays} \sum_{\psi=0}^{x_t} P(\psi) \cdot P(\zeta)) \right)$$

$$= \sum_{t=1}^{Ndays} ln\left(\sum_{\psi=0}^{x_t} p \cdot exp(-a \cdot \lambda_t) \cdot \frac{1}{\psi!} \cdot (a \cdot \lambda_t)^{\psi} \quad + \quad (1-p) \cdot exp(-b \cdot \lambda_t) \cdot \frac{1}{\zeta!} \cdot (b \cdot \lambda_t)^{\zeta} \right)$$
